DECLARE
Event corpus
each event carries an interval $(t_L, t_R]$ and a dating stratum
Observation graph
m relations over one node set, one of them the target $r^\star$
Provenance declaration
which relation is $r^\star$, which are anchors, which are ineligible
declared in writing before any statistic; timestamped for corpus A
COMPUTE
U1
at what lead time does $r^\star$ re-enter the band?
U2
how much discrimination survives with densities alone?
U3
how much does a fitted model lose without $r^\star$?
Focal isolation
is the member on the group's own record before it joined?
absent from the original specification
REPORT
$\hat{\Delta}^\star$, a conservative estimate
a model dependent estimate, and the interval's upper end is not identified
different objects, often confused
measured back-dating width
a measurement: needs a source that codes two dates
